Practice 1-E

Three differences between Python 2 and Python 3:

1- 'Print' in Python 2 is a statement (it has no parentheses) but in Python 3 it's a function, print ().

2- Python 2 has ASCII str() types, separate unicode(), but no byte type.

   Now, in Python 3, we finally have Unicode (utf-8) strings, and 2 byte classes: byte and bytearrays.

3- Integer division:
   This change is particularly dangerous if you are porting code, or if you are executing Python 3 code in Python 2, since the change in integer-division behavior can often go unnoticed (it doesn't raise a SyntaxError).
